Assessment of BPSD

Behavioral and Psychological Symptoms of Dementia

- Assess patients with dementia for the type, frequency, severity, pattern, and timing of symptoms
  - Why?
    - Help in identifying possible contributors to symptoms
    - Establish baseline level and pattern of symptoms to assess later treatment response
  - How?
    - Obtain via face-to-face evaluation, review medical records, and/or history (including from family and friends)

*American Psychological Association
Common Triggers to Behaviors

- Hunger, fatigue, pain, too hot, or too cold
- Recent medication change or change in response to the medications (e.g., increased symptoms, side effects, drug interactions)
- Physical issues (e.g., infection)
- Discomfort or distress related to bowel or bladder issues (e.g., constipation, incontinence)
- Under-stimulation or over-stimulation (e.g., boredom, loneliness, noise, clutter or other environmental factors)
Other Common Triggers

- Vision or hearing deficits
- Confronted with cognitively challenging situations or demands
- Being assisted with or rushed to complete tasks (e.g., bathing, dressing, or other activities of daily living)
- Feeling a loss of privacy, modesty, or other loss of control
- Sensing frustration, anxiety, or other emotional distress of caregivers
# Evaluating Symptoms

Identify the underlying causes of distress, agitation, or aggression

Antipsychotic Drugs Used Off-Label

- Despite known dangers, antipsychotic drugs are commonly prescribed to elderly nursing facility residents for uses not approved by the FDA:
  - To control unwanted or challenging behavior caused by dementia;
  - To avoid increased staffing and training needs for non-pharmacological interventions to modify these behaviors.
Dangers of Antipsychotic Drugs

- Increased mortality when used for dementia-related psychosis
  - FDA Black Box Warning – most serious type of warning that appears on the package insert
  - There is no FDA-approved psychotropic drug treatment for dementia-related behaviors
- Increased risk of stroke, heart attack, death
- Should not be used routinely and should be regularly assessed
- Potential risks and benefits must be assessed by the clinician and discussed with the patient (or representative)

**Antipsychotic Drugs with Black Box Warnings**
Impact of Psychotropic Drugs

Affect mental activity, emotion, and behavior (e.g., antipsychotics, antidepressants, mood stabilizers)

- Side effects can be harmful; diminish quality of life
- Results in increased vulnerability to infections
- Cause excessive sedation, lethargy, dizziness, unsteadiness which can lead to increased falls and injuries, increased risk of bed sores
- Parkinsonism (tremors and rigidity), body restlessness
- Reduced well-being, loss of appetite, social withdrawal
- Accelerated cognitive decline
Failure to Monitor after Drugs are Administered

Many facilities administer the drugs and do not monitor the consequences:

**Antipsychotic Drugs can cause:**
- Drowsiness
- Lethargy
- Dizziness
- Confusion
- Restlessness
- Loss of appetite
- Dysphasia
- Tremors
- Rigidity
- Increased vulnerability to infections

**Leading to:**
- Falls
- Weight loss
- Dehydration
- Shuffling
- Incontinence
- Pressure Ulcers
- Difficulty communicating
- Social withdrawal
- Isolation
- Death
Nonpharmacological Interventions are Preferred, Safer

Clinical Guidelines*

- Assess the scope and severity of the behavior
- Identify any environmental triggers for the behavior
- Determine if behavioral symptoms are associated with another medical condition (e.g., pain, constipation, dehydration)

- Use drugs only:
  - When other, non-pharmacological attempts to ameliorate the behaviors have failed; AND
  - The individual poses a threat to themselves or to others

*AMDA, The Society for Post-Acute and Long-Term Care
Nonpharmacological Strategies are Preferred, Safer

- Shown to reduce agitation and anxiety in dementia
- Techniques should be individualized
- Incorporates:
  - Behavioral interventions
  - Caregiver education and training
  - Sensory techniques
Behavioral Interventions

Nonpharmacological Strategies

- Avoid, remove triggers – noise, light, temperature, etc
- Ensure a consistent routine and environment
- Avoid sudden changes
- Determine/anticipate unmet needs (e.g., pain, thirst, hunger)
- Recognize that language and memory deficits can hinder communications of what is needed
- Provide person-centered care
Caregiver Education and Training

Nonpharmacological Strategies

- Knowing the individual – likes, dislikes, preferences, routines, history
- Caring for individuals with dementia, cognitive impairments
- Communication skills training
- Provide calm, reassuring communication when patients seem anxious
- Use redirection and distraction techniques
Sensory Techniques

Nonpharmacological Strategies

- Aromatherapy
- Music therapy
- Massage and touch therapy
- Exercise
- Pet therapy
Other Strategies

Nonpharmacological Strategies

- Monitor closely
- Stop non-essential medications
- Reduce psychiatric symptoms
- Provide cognitive structure/emotional support
- Maintain function
Rights and Responsibilities

Federal Rules and Requirements
Residents’ Rights

Federal Requirements

- Treated with respect and dignity and care for each resident in a manner and in an environment that promotes maintenance or enhancement of quality of life, recognizing each resident’s individuality

- Free from physical or chemical restraints

- Informed, consent, or refuse treatment

- Choose a physician

- Free from unnecessary drugs – i.e., excessive dose, excessive duration, without adequate monitoring, without adequate clinical indications for its use, presence of adverse consequences indicating dose should be reduced or discontinued

- Informed of, and participate in, treatment, including the right to request, refuse, discontinue treatment
Facility Responsibilities

Federal Requirements

- Sufficient staff to assure resident safety and provide services for each resident to reach or maintain their highest level of well-being

- Assure staff have the skills and training around:
  - Caring for residents with mental and psychosocial disorders
  - Implementing non-pharmacological interventions
  - Dementia management
  - Abuse prevention

- Assessment and care planning

- Medical Regimen Review, at least monthly, but more frequently, if necessary
Requirements Specific to Antipsychotic Use

Federal Requirements

- Residents who have not used psychotropic drugs are not given the drug unless necessary to treat a specific condition as diagnosed and documented in the clinical record.

- Gradual dose reduction and behavioral interventions (unless clinically contraindicated).

- PRN (as needed) psychotropic drug use limited to 14 days.
  - Unless evaluation by the attending or prescribing physician for appropriateness; and documentation of the rationale in the medical record.

Quality measures rating

Above average

Short-stay quality measures

Average

Long-stay quality measures

Much above average
Long-stay quality measures

The long-stay quality measures rating reflects the average level of a nursing home’s performance in certain areas of care for those who stayed in a nursing home for 101 days or more, and whose typical goal is to maintain or attain their highest possible well-being while residing in the facility.

Number of hospitalizations per 1,000 long-stay resident days

- 0.80
  - Lower numbers are better
  - National average: 1.40
  - Pennsylvania average: 1.24

Number of outpatient emergency department visits per 1,000 long-stay resident days

- 0.56
  - Lower numbers are better
  - National average: 0.86
  - Pennsylvania average: 0.58

Percentage of long-stay residents who get an antipsychotic medication

- 15.9%
  - Lower percentages are better
  - National average: 14.5%
  - Pennsylvania/vanka average: 15.5%

Percentage of long-stay residents experiencing one or more falls with major injury

- 5.3%
  - Lower percentages are better
  - National average: 3.4%
  - Pennsylvania average: 3.4%

Percentage of long-stay high-risk residents with pressure ulcers

- 2.4%
  - Lower percentages are better
  - National average: 8.2%
  - Pennsylvania/vanka average: 7.7%
What to Look For:

- Lower rated facilities (i.e., 1 star, 2 star)
- Staffing problems
- Behavioral health issues
- Onsite observations
- Complaints

<table>
<thead>
<tr>

Avoiding Drugs as Chemical Restraints

CONSUMER FACT SHEET

Everyone who enters a nursing home has a right to individualized, person-centered care. Some nursing facilities, however, may use drugs without a medical diagnosis, such as to treat behaviors or for the staff’s convenience. When used this way as a chemical restraint, these drugs pose special risks for older people and increase the risk of death in persons with dementia.

Signs of Someone at Risk for Chemical Restraints

When individuals, including residents with medical conditions such as dementia, are unable to express themselves using words, they express themselves through actions. For example, a resident may repeatedly moan to show they are in pain. These actions should not be dismissed. Instead, they should be evaluated to identify what the resident is trying to communicate. Other examples of behavioral communication that require further evaluation include:

- Anger, Chewing, Agitation
- Screaming, Swearing, Spitting
- Writing, Drawing, and Painting
- Confusion, Inattention, Delusions
- Crying, Screaming, Fussing
- Continuous wandering, Repetitive actions, Failure to cooperate

These actions or behaviors are signals that something is wrong!

Signs that A Resident May Have Been Chemically Restrained

Negative effects often associated with chemical restraints can also be the result of other factors such as illness or adverse effects of other drugs. However, if a resident has the following symptoms, ask questions and see that their drug regimen be reevaluated:

- Sudden difficulty waking the resident to eat or for a check
- Decreased thinking, delirium, depression, hallucinations, delusions
- Dizziness
- Dry mouth
- Decreased appetite
- Tooth or dental problems (teeth bruxism, involuntary movement of the jaw, tongue, and sometimes the trunk, fingers, and hands)
- Parkinson symptoms

Pursuing Quality Long-Term Care

A CONSUMER EDUCATION PODCAST

Know Your Drugs & Know Your Rights

Questions to ask your care provider and a list of drugs often used as chemical restraints

Meditations can be helpful if they are treating an illness. It is important to be aware of whether a drug is being used for treatment or as a restraint. You should be told about any drug before it is given and the opportunity to stop it if you so choose. If you consent or want the restraint, you should be told about the risks and benefits. The following are questions to ask, and the list below are drugs often used as chemical restraints.

- Why was this drug ordered? What symptoms or behavior prompted it?
- What are the side effects of this drug?
- Is this medication specifically for the cause/symptoms?
- What is the non-drug option?
- What was done to treat or eliminate the cause/symptoms before resorting to this medication? Are enough alternative treatments tried first?
- Is the drug one of those with a black box warning?
- What are the side effects of the medication?
- Why do you believe the benefits outweigh the risk?
- What possible interactions will it have with other drugs?
- What is your plan for monitoring the use of the drug and weighing off/stopping it?
